

Online platform where you can completely manage, from the cloud, any facility. This platform enables access for both Operators and Users, permitting different profile options depending on the person accessing the system.

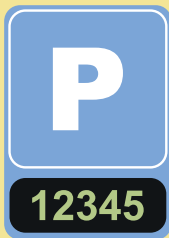

Our system can be customized, both in parameters and appearance. This allows Control Panel to show the corporate identity of distributors or facilities, even linked from your own webpage.

It allows the connection of an infinity of machines, devices and systems. Control Panel has some communication APIs that allow information transfer between these points.

- ✓ Online platform
- ✓ App for smartphones
- ✓ Customized level profiles
- ✓ Report generation
- ✓ Tariff configuration
- ✓ Movement monitoring

Parking lots

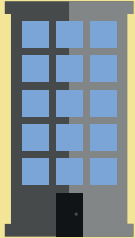

In a parking lot, *Control Panel* manages occupancy, books parking spaces, controls access to the facility, registers images from surveillance cameras, detects license plates and controls collection among other tasks. Moreover, it is possible to create user profiles in which you can assign different modules or fields of the system.

You can integrate the automatic guidance system, the control of occupancy indicators and other information signs into our platform or indeed any other device present in this type of facility. With this platform, you can receive warnings for lack of paper or breakdowns. In addition, *Control Panel* allows you to check cashier and ATM collection, knowing how much has been collected. You can also know how much money the ATM contains and if there is a need to refill. You can control either a small parking lot or several facilities on the same platform.

Control Panel can link operators to one or more installations and create specific tariffs for each facility or the same tariff for all. Registered users have a web account, from which they can see their movements and make bookings in one or more facilities.

Buildings

Control Panel allows integration with access control, video surveillance, attendance control, parking lot, bookings, round control and also manages connected devices like air-conditioning, irrigation, illumination and others on the same platform.

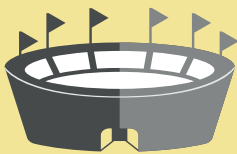

You can know the state of several facilities from anywhere. This allows the centralization of human resources in one point. Apart from this, thanks to the IP Intercom you can communicate with any equipment.

Inside the visitor managing module you can create a visitor schedule, manage the credentials for this kind of users or control their access authorization to different areas.

With *Control Panel* you can manage access registration to a building in a simple way. *Round control* is also integrated into reports, so you can know at any moment if maintenance and surveillance rounds are being met as planned.

Events: management and facilities

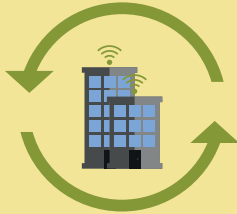

One of the most important features in *Control Panel* is ticketing sales in enclosures of events and shows. This platform allows you, in a simple and intuitive way, to make bookings and sell tickets by different methods (APP, website, ATMs or directly by operators).

Booking management is a fundamental part of every event. In our system we allow users to make bookings for tickets, parking places and other additional services and products available in each event. Facilities with parking lots can manage it on the same platform as the rest of their activity. This way, you can allow users to pay for their stay in the parking lot with the show ticket or separately. In addition, if a user has made a booking and/or has a ticket for the show, they can use it as a credential for parking access.

You can integrate all access control devices into *Control Panel*. This option allows you to know the state of capacity at all times as well as restricting access to private areas. Our module Indoor maps is integrated into *Control Panel* so if you install appropriate sensors, this app guides users to their seats or to a specific area by following instructions on their mobile phone.

Smart city

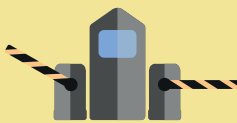

Control Panel can integrate parking meters, LED panels and signs, noise and pollution sensors, irrigation systems and any other device present in cities. From our platform you can check the status of the equipment in real time, knowing the collection of parking meters, the humidity of the ground or the level of ambient air pollution in a certain zone. You can also manage indoor parking lots and make joint reports or comparative reports.

The integration of video surveillance into *Control Panel* permits you to display images of your cameras from any part of the world. If you add a plate recognition system, you can locate vehicles and emit alerts depending on the settings.

Inside our platform you can find the system *Where have I parked?* that helps users to locate their vehicle. This system is based on Bluetooth and/or GPS technology. Users only have to download our APP onto their smartphone. This APP also allows you to pay on streets with regulated parking.

Industrial parks

Control Panel allows the management and control of different areas associated with industrial parks. You can control pedestrian and vehicular access, check surveillance or maintenance rounds and the consumption control of users, operators or building other tasks.

Inside *Control Panel* you can integrate the *Tracking* module for people or vehicles. This module uses various technologies like GPS, WIFI, Bluetooth and mobile phone networks. This tracking can be approximate or precise and can be used indoors or outdoors.

All the information of the industrial park is available with different access levels depending on your profile. You can access different information thanks to it.

Visitor management is also integrated so access control is complete. You can pre-authorize the access of any vehicle or person and assign a person or company representative to each visit. This system generates a sense of security in the facility and prevents unauthorized access.

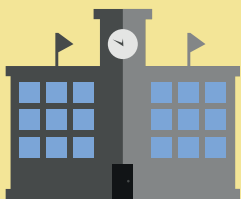

Harbor management

Control Panel allows the management of different areas inside a harbor like access control, parking management, booking and mooring management, control of consumption, supervising maintenance, surveillance tasks and others.

Inside the mooring management you can display the occupancy of the harbor, allocate mooring places for visitors and collect for this service. Thanks to the automatic supply control, you can collect for the consumption of water, electricity and other services consumed by users. With this system you can avoid manual revision of supply meters.

If the facility has a parking lot, you can manage it and the devices present in the harbor jointly and on the same platform. This centralization of information allows users to access with the same credential in the parking area and in the moorings or other zones. You can also apply discounts in sales or rentals of available products and services in the facility.

Public administrations

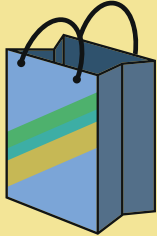

Video surveillance system is integrated into our platform and it allows the identification of people and vehicles in the outer areas of public facilities. Round and attendance control systems are also integrated into *Control Panel* to improve the registration and monitoring of the surveillance, usage and maintenance of the installations.

The integration of the *Tracking* module into *Control Panel* lets you know the exact location of people or official vehicles being surveilled.

Our sign posts are integrated into the platform, allowing the management of messages displayed on this equipment and their activation and deactivation. Some of the utilities of these devices are the transmission of messages of interest to citizens, traffic warnings or advertising events financed by Public Administration.

Inside *Control Panel* you can find the management of parking on and off street.

Commercial establishments

Control Panel allows the management of access control for users and employees in facilities. If the commercial establishment has a parking lot, *Control Panel* allows you to combine the management of all equipment in it.

We offer different types of payment equipment, all of these integrated into *Control Panel* to make accounting and collection tasks easier. You can also use discount vouchers easily.

Our innovative system *Indoor Maps* makes the location of places of interest (stores, cinemas, restaurants or toilets) easier and users can receive information about how to arrive at these places on their smartphones.

The video surveillance and the round control are integrated into our platform, allowing you to check the maintenance and surveillance tasks that are planned. All this in one online platform that is governed by permits and level access, so you have several possible configurations.

Ski resorts

Control Panel allows complete management of ski resorts. Book ski passes and stays, control slope access, manage the parking lot and rent equipment and material from the same platform.

You can integrate surveillance cameras to display the condition of slopes and ensure safety in the facility. You can also integrate weather information collected in situ from the platform. With this, users can know the current weather and historical data of weather conditions.

With our turnstiles and physical security equipment integrated into our platform, we can guarantee the correct use of areas like access to slopes, toilets, changing rooms and chairlifts.

You can generate as many users as you wish, so you can control where and at what time each user accesses in an easy way. This system allows you to offer different tariffs to different types of users.
